

1) Billy used base ten blocks to calculate  $96 \div 3$ .

a) Complete the calculation:  $96 \div 3 = \square$

b) Write and solve the calculation shown in each representation:

$66 \div 3 = \square$

$86 \div 2 = \square$

$84 \div 4 = \square$

2) Use place value counters or base ten blocks to calculate  $62 \div 2$ .

$62 \div 2 = \square$

1) Lee has used a part-whole model to calculate  $48 \div 4$ . He has partitioned each number in the calculation and worked out that the answer is 24. Marisa thinks Lee has made a mistake. Who do you agree with? Explain your reasons.

---

---

---

2)

The answer to  $96 \div 3$  must be greater than the answer to  $68 \div 2$  as both the divisor (the number you are dividing by) and dividend (the number you are dividing) are greater.

Do you agree with Marisa? Explain your reasons.
